1. What is the AI Tool Policy?
2. How can AI tools help you at work?
3. Q&A

VINCIT AI TOOL POLICY

Released in April 2025

Have you taken a look at the first version of our

AI TOOL POLICY?

- Guidelines for the **internal use** of artificial intelligence (AI) tools within Vincit.
- Applies to all employees, contractors, and third parties who use of AI tools within Vincit's IT environment.

Responsible Use

You are encouraged to use AI tools to improve efficiency and support your work. Be thoughtful, as **responsible use is essential.**

Do

- **Always** follow our information classification policy when using AI tools (see Recommended AI tools table below).
- **Always** use tools recommended by Vincit or make sure that the AI tools meet our requirements.
- **Always** use trusted vendors with transparent and solid privacy and security practices.
- **Always** review AI outputs before sharing to ensure they're accurate and free from sensitive information.

Don't

- **Do not** input customer or regulated data and information (e.g., documentation, source code, project plans) into AI tools unless you have written authorization* *and* the data use aligns with this policy.
- **Do not** use AI tools banned or sanctioned by regulatory bodies (e.g., Data Protection Authority, Traficom, industry-specific regulators).
- **Do not** use AI tools that have raised ethical concerns or compliance issues.
- **Do not** use **non-public** data on tools that train on your input or share the data with third parties.

🤔 **Pause and check with #sig-ai-security** if you're unsure or spot a potential issue.

Know Your Data

- **Public** – Open to everyone (e.g., website content, open-source code)
- **Internal** – For all Vincit employees (e.g., internal guides, general communications)
- **Confidential** – Limited to specific roles (e.g., customer contracts, financials)
- **Secret** – Highly restricted (e.g., board materials, strategic initiatives)

See the Classification of information Policy for more details.

AI Tool	Public data	Internal data	Confidential data	Secret data	Code Generation	Codebase Access
Google Workspace AI, e.g., Google Gemini and NotebookLM (Company Enterprise license)	✅ Allowed	✅ Allowed	✅ Allowed	✅ Allowed	✅ Allowed	⚠️ Restricted*
Vincit ChatApp (Azure OpenAI)	✅ Allowed	✅ Allowed	✅ Allowed	❌ Not allowed	✅ Allowed	⚠️ Restricted*
Microsoft Co-pilot (enterprise) TBD	✅ Allowed	✅ Allowed	✅ Allowed	❌ Not allowed	✅ Allowed	⚠️ Restricted*
GitHub Copilot for Business	✅ Allowed	❌ Not allowed	❌ Not allowed	❌ Not allowed	✅ Allowed	⚠️ Restricted*
ChatGPT (free, plus)	✅ Allowed	❌ Not allowed	❌ Not allowed	❌ Not allowed	✅ Allowed	⚠️ Restricted*
Microsoft Co-pilot (public, free)	✅ Allowed	❌ Not allowed	❌ Not allowed	❌ Not allowed	✅ Allowed	⚠️ Restricted*
Google AI Studio	✅ Allowed	❌ Not allowed	❌ Not allowed	❌ Not allowed	✅ Allowed	⚠️ Restricted*

AI POLICY AT VINCIT:

More details on our [Vincit Way Confluence]

This is how we use AI tools responsibly

Public data	Internal data	Confidential data	Secret data	Code generation	Codebase access
👍	Gemini NotebookLM ChatApp Copilot ChatGPT	Gemini NotebookLM ChatApp	Gemini	Gemini NotebookLM ChatApp Copilot ChatGPT	⚠️ **Restricted** *Permitted only with the customer's written permission.

ChatGPT

AI IN YOUR WORK

Tips & Guidelines also in [our Confluence]

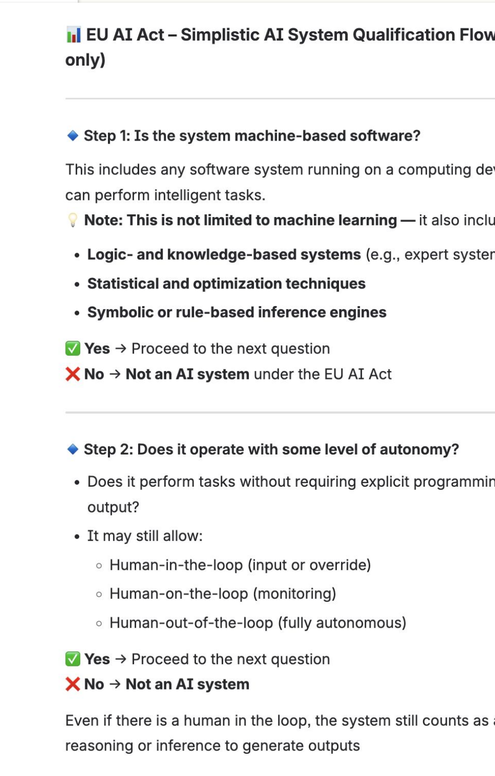

We have created simple guidelines to answer the following questions:

- ➔ How to prompt effectively and safely?
- ➔ AI Tool Risks: What to Watch For
- ➔ AI and Copyright: Key Considerations
- ➔ Data privacy and protection
- ➔ EU AI act prohibited uses across the EU
- ➔ High-Risk AI Systems
- ➔ Limited-Risk AI (Transparency Obligations)
- ➔ Minimal Risk AI
- ➔ EU AI Act – Simplistic AI System Qualification Flowchart

How can AI tools help me?

1 **Semantic search**	• Ask questions in natural language
2 **Help with translations**	• Advanced AI tools can also consider context, tone, and industry-specific terminology
3 **FAQ creation**	• Analyze and summarize documents to identify common questions
4 **Content creation**	• "*Write a one-page article about common mistakes when selecting a new mobile phone*" • Draft blog posts or customer-friendly text • Generate ideas for presentations, brainstorming, and documentation
5 **Summarization**	• "*Create a brief introduction for this document in three sentences*"
6 **Code review**	• Check code snippets or error messages • Get help with writing code
7 **Sentiment analysis**	• Identify patterns in sentences that indicate positive, negative, or neutral sentiments
8 **Research**	• Find general industry trends, best practices, and non-confidential knowledge • Summarize public documents, articles, and reports
9 **Data analysis**	• Help with data visualization, trend analysis, and summaries • Write non-confidential code snippets or explain programming logic
10 **Automation & efficiency**	• AI-generated templates, checklists, and workflow optimization • Better productivity in repetitive tasks

📊 **EU AI Act – Simplistic AI System Qualification Flow only)**

🔷 **Step 1: Is the system machine-based software?**

This includes any software system running on a computing de can perform intelligent tasks.

💡 **Note: This is not limited to machine learning —** it also inclu

- **Logic- and knowledge-based systems** (e.g., expert syster
- **Statistical and optimization techniques**
- **Symbolic or rule-based inference engines**

✅ **Yes** → Proceed to the next question
❌ **No** → **Not an AI system** under the EU AI Act

🔷 **Step 2: Does it operate with some level of autonomy?**

- Does it perform tasks without requiring explicit programmin output?
- It may still allow:
  - Human-in-the-loop (input or override)
  - Human-on-the-loop (monitoring)
  - Human-out-of-the-loop (fully autonomous)

✅ **Yes** → Proceed to the next question
❌ **No** → **Not an AI system**

Even if there is a human in the loop, the system still counts as reasoning or inference to generate outputs

THE POLICY IS YOUR GUIDE, NOT A GATEKEEPER

Think of it as a guide for how to choose tools, not a final list of every tool we can (or can't) use.

This is a huge shift, and nobody has all the answers.

The common theme in our answers to all your great questions is: collaboration.

Security & responsibility

Can Vincit produce an AI policy that tells us which tools are safe to use, how to use them, how to get licenses for them? Now it's a true wild west with these tools, and I'm not comfortable using any of them, but I feel that the company almost forces them upon us without any real guidance. Ultimately the developer is responsible for what happens, and I don't trust these tools. Maybe it's the customer's decision, but they're even less informed about the risks than we are.

***Jesse**, Wellu, Piritta, Janne*

The Vincit AI tool policy is in place to guide and help Vincitizens to use AI to support the work at hand. The policy establishes the guard rails and gives instructions on how and when it’s possible to use AI tools.

There are currently a limited number of tools mentioned within the policy, but the plan is to establish evaluation criteria to better manage them. In short, less critical AI tools can be evaluated lightly, and more critical (e.g. handling sensitive data) will require a more robust approach.

It’s also important to be aware that as with any tool or cloud solution, our customers ultimately decide what we can use and what we can’t. So even if Vincit AI policy allows something, the customer’s own AI policy might prevent it. In these cases we always follow the customer’s guidance.

As a rule of thumb: if both Vincit and customer policy allows it, it’s safe to use. If either policy restricts it, it should not be used.

When you work on your AI Plan and come up with questions, you get help by asking.

When there's lots of AI generated code that no-one truly understands deeply, who's responsible for the eventual security incidents, etc.? Can devs say they were just following orders?

Eero, ***Wellu***

The responsibilities between Vincit, other vendors and our customer are always defined for each customer delivery and there can be variations.

In most cases, Vincit is responsible for the deliveries that we produce for our customers. In practice, this means that the developer who introduces the change (with or without AI assistance) is responsible for the change.

We encourage the normal practices of pull request reviews and peer reviews for changes, regardless of if the code was generated by AI or human.

If things go wrong for any unintentional reason, Vincit is insured, supported by legal aid and will have your back.

- **Can we use Miro AI feature for customer workshopped data?**
- **Generally speaking, is it authorized to use AI assistants (that execute tasks like generating code based on the project as context) in Vincit projects?**

***Victoria**, Jesse*

Always start by checking **what data** you are going to process. Is it Vincit or customer data? It is personal data, and what data classification category it falls into?

Based on this, you can use the AI tool policy to answer the question of what tools you can use.

In the case of Miro, first you need to know if the customer approves of its use. Please note that Miro currently does not guarantee that the data will remain within the EU, so no personal data should be used there.

Note that if you enable a tool to have codebase access (customer must agree).

How is Vincit consulting companies with the legal ambiguities of AI tools and handling of sensitive data?

In my project we work with sensitive data and our customer's legal team has only allowed usage of AI tools where sending the data for teaching the model can be disabled (so in our case we can use only business version of Github Copilot), So we're missing a lot of tools that seem to be getting more and more common these days. As programming professionals we know that we create any new and imaginative ways to handle sensitive data, but instead we do things that thousands of other code bases have more or less the same and AI models don't have access to the actual data, so using all the other models should be completely fine.

Piritta

We, as every other organization are also learning how to best leverage AI in a responsible way.

We have for example now AI Plans rolling in DS, later this will be done company wide. When we agree on the AI Plan with our customer, we initiate a discussion with the client regarding their existing AI policy and their potential need for consulting on the legal ambiguities of AI tools and handling of sensitive data.

Client Autonomy First: While Vincit can provide the necessary consulting to navigate these complex legal and technical issues, we do not force clients to change their established practices or policies.

Compliance Guarantee: If the client chooses not to change their current AI policy, we will ensure the AI Plan is strictly formulated to comply with both the client's and Vincit's existing AI guidelines.

Shortly: We offer guidance and expertise, but the client retains the final decision on their operational policies.
AI Plan is a document that we agree with the customer. It describes which AI tools we use in the delivery and how Vincit can assist the customer with AI matters in the future. You find Ai Plan templates here.

Tools, licenses & costs

Tools, licenses & costs

- **Why can't Vincit get us the licenses to do proper AI work?** Someone said the client should pay, but the client doesn't pay for our computers or phones or other software we use. Why should they pay for our AI software that we will use with multiple clients?
- **How big of an AI bill am I allowed to generate per month?** Customer likely isn't paying it.
- **Can we please get unlimited tokens for copilot, at the very least.** Cursor would be better. All it would take to cover the cost is add 30 minutes of billing a month to client. **Why are you making it so complicated?**

***Jakub**, Piritta*

You can have any tools that are needed for your work

Customer Work:

- Vincit provides core tools for all (e.g., Google, Slack, M365, and Github). This should be communicated to the customer when starting a new project and agreeing on which tools will be used. This is a logical time to inform the customer that they are responsible for the costs of any additional project-specific tools needed. This also applies to tokens. (AI saves time=money)
- You can order the tools mentioned above from IT. This includes Github Copilot if you are using Github.
- If other AI tools (e.g., Cursor, JetBrains Junie, CodeRabbit, or ChatPRD) are used, agree with the customer on who will purchase the licenses: the customer or Vincit's Delivery Lead.
- If Vincit pays for the licenses, the costs are allocated to the project and must be invoiced whenever possible. If invoicing the customer is not possible, the Delivery Lead checks the project's profitability and makes a business decision regarding whether the costs are acceptable for the project.
- Note: Tokens are always invoiced from the customer.
- **Document these things in AI Plan that is agreed with the customer.**

Internal Work/Learning:

- If you wish to learn AI tools that cannot be used in your project, create a learning plan (Goal on hibob) and agree on it with your supervisor. After that, you can place an order: Github Copilot and Cursor from IT. Other licenses: Ask your supervisor.
- The costs are allocated to your BA. Any additional costs, e.g., tokens, are also approved by your supervisor.

Will our AI strategy remain the same even if the AI tool prices would get higher?

We should be prepared that the price tag will go up, even at the moment its relatively cheap to use.

Jakub

We evaluate costs of all tools and systems we use. Price is one of the very important aspects we check.

Any tool we use should provide business value, and it should be higher than the cost of the tool.

In practice, we have just started IT and Business alignment follow ups where we are to agree on tools that should be added to the default catalogue, and those that should be removed from it.

Could we have up-to-date list of AI tools that Vincitizens can request a license to? At the moment it is very hard to know which tools can be used on company's expense.

Jesse

You can find a list of tools currently licensed under IT from the below link.

https://vincit.atlassian.net/wiki/spaces/AS/pages/9740615681/Current+Licenses+Budgeted+by+IT

This should help better indicate what the tools will cost, and aid in budgeting them.

In general, delivery-related licenses should be invoiced to the customer, but it is not always possible. In those cases, the delivery lead will make a business decision on whether the costs are acceptable internally.

When you work on your AI Plan and have questions related to AI tools, ask help in #ask-ai-tool-policy or send DM to Piritta Karppelin.

My understanding is that claude code is one of the most advanced assistants for developing software, why is it excluded from the AI tool policy list?

Jesse

The AI Tool Policy is a policy that provides higher level guidance on tool usage.

We have many contractual and legislative obligations as a company in order to provide our services, and we need to meet them. That is why the AI tool policy is in place to guide our tool usage, so it’s compliant with our requirements.

AI tools are treated as any other tool, if you need it for work and it has been approved, then you can use it.

If you want to advocate for a wide adoption of specific tools, please talk to your Cell Lead or Business Area Lead. You as experts in given field know best what tools are out there.

Why it is not allowed to remove old chats in Google Gemini?

Host

It is a feature in Google, we have no control over it.

Why it is allowed to use MCP servers in Cursor but not in VS Code?

Manu

MCP carries some security risks, that users should be aware of. Unfortunately, that setting is global for GitHub copilot and it’s currently disabled in Copilot.

Advanced users can utilize MCP services, for example in Cursor, but I hope they ensure they do not connect their IDE:s to insecure servers.

Does Vincit ChatApp already use GPT-5?

***Manu**, Jesse*

There's GPT-5-mini generally available and that's the default mode for ChatApp.

We only use the models that are available in European region. GPT-5 Data zone standard deployment is available in Azure only on request and with restricted capacity.

However, **ChatApp will be deprecated and phased out** in near future.

We're working on a dedicated LLM API designed for more advanced users.

Training & career development

- **Can we get some AI tool training?** Like some baseline know-how that applies to every project. Vincit has copilot and gemini licenses, but there has been no education in how to use them. Are we supposed to just figure it out and possibly make some dire mistakes along the way?
- **What kind of sessions will there be for developers to hear good tips using AI?** Some kind of sessions where tools and tips are shared would be especially beneficial for those who are busy in projects.

Victoria*, *Piritta

We have written practical guidelines that answer the most common questions related to AI tools usage for your work along our AI Tool Policy.

Also we have many AI related courses available in Univincity (more Agentic trainings upcoming).

We will add Github Copilot and Cursor training videos to Univincity soon. You can also check videos from Youtube related to AI tools.

If you want to join the 5-Day AI Agents Intensive Course with Google (Monday, November 10 - Friday, November 14) register here.

Vincit is currently exploring enterprise licensing with the most used AI tools such as Cursor (news soon)

Got more questions -> #ask-ai-tool-policy

The message, to put it bluntly, is that if you are not firmly on the AI train, you will soon fall out of this industry.

What if you are in a (possibly long) project where the effective use of AI tools is not possible for one reason or another? What is the best course of action?

a) Continue in the project and hope for the best, b) Actively try to find another, AI-positive project within Vincit, c) Leave Vincit, if at all possible, d) Something else, what?

***Piritta**, Eero*

This is a valid concern. It's great that you're motivated on developing your AI skills!

If you cannot use AI tools in your current project:

Make a learning plan: Talk to your supervisor about what AI skills would be beneficial to study during the project. A concrete plan helps break down learning into manageable parts that fit into your daily work.

Utilize Vincit resources: Grow your expertise through Univincity courses, study groups, and internal training sessions. You can also use the competence development bonus to learn new skills in your free time, if you choose to.

Plan the future: Discuss with your supervisor what kind of future project would allow you to utilize your new AI skills and when that transition would be timely.

In short: Talk to your supervisor about your situation to get the support needed for competence development.

Training & career development

Lately Vincit has been facing issues in projects due to not paying enough attention to project management. As we are fixing this and hopefully paying more attention on the topic, I think that bringing AI into projects as big as we have now heard will add another layer of challenge to managing our projects.

How will those in charge of developing our project management take into consideration the change in projects, that comes when our ways of working change so greatly? What kind of support can a project lead get related to managing a project done mostly with AI?

Examples: customer expectation management, team's change resistance, team's use of new tools, team learning new ways of working, work estimates, pricing change from hourly to value based, security etc. etc.

***Eero**, Piritta, Wellu*

We are facing intense market pressure, tighter project pricing, and rapidly evolving tools. Improving productivity while learning new things is tough. At the same time, we must ensure we remain a reliable partner to our clients.

We are in the middle of a major shift where nobody can fully predict the outcome. In such a situation, the role of **consultation** and **communication** becomes even more critical.

It is important that we understand what the customer needs and expects. Part of our consulting role is informing the client if their expectations are incorrect. It is also fine to let them know that AI tools are evolving fast, and we are learning new things as we work. Let’s share learnings with the customer. We must also make and follow a risk management plan.

Extraordinary Together means working together with the customer. We aim to build a relationship based on mutual trust. That helps when we need to handle changes if they arise.

Project Leads and Project Managers have support available from the Head of Deliveries and supervisors. Let’s also remember that even though the Delivery Leads are leading the projects, the work is always done collaboratively.

AI in general

How much AI-generated code have you deployed to production personally? How was the quality?

Manu

AI assistants can struggle with business rules. Monitor the output and do complex parts yourself.

AI-generated code and docs often improve overall quality. Even if you don’t use code generation, try to use AI to write method descriptions and READMEs.

Many teams find AI-generated tests cover more cases and catch bugs earlier—better than no tests or only basic tests.

Always review and understand AI output when you are shipping features to production.

OpenAI reports that hundreds of thousands of users show signs of manic or psychotic behavior weekly:

Have you experienced feelings of manic or psychotic behavior with AI? What to do if you notice yourself or a colleague behaving manically or psychotically due to the influence of AI?

***Eero**, Piritta*

It is important to take care of your own well-being and care of your colleagues.

Living through change, increasing demands, and a growing cognitive load are putting our workplace skills to an even tougher test. It is important to cherish routines that support well-being. Also when working with AI.

If you are worried about your own wellbeing, contact your supervisor or Mehiläinen. You will get help.

If you are concerned about a colleague, please notify their supervisor or your own supervisor, who will relay the message. That is caring.

Do you see AI as a tool or a team member?

Victoria, Piritta

We see AI as a tool that enhances our productivity. But with great toys comes great responsibility, we must ensure we know how to use it. This means a paradigm shift in how we work, i.e. manual coding to orchestrating workflows.

Anything else you'd like to know?

We had to skip one question that was sent to us, but we'll get back to that!

Raise your hand and ask away, or use the chat.

Upcoming changes

VincitChatApp (retires on Dec/25)

LLM API Gateway (will be launched on in coming weeks / Q4)

Cursor enterprise licensing under works

THANK YOU

See you at #ask-ai-tool-policy

Ps. Start creating your AI Plans. They will help you formulate questions and get the assistance you need to move forward with AI.
Ai Plan templates can be found here.
Feedback and questions: DM Piritta
